### SPEED – Spectral Elements in Elastodynamics with Discontinuous Galerkin

SPEED is an open-source code designed with the aim of simulating large-scale seismic events in three-dimensional complex media: from far-field to near-field including soil-structure interaction effects.

SPEED combines the flexibility of discontinuous Galerkin methods to connect together, through a domain decomposition paradigm, Spectral Element blocks where high-order polynomials are used. SPEED heavily exploits parallelism in the framework of explicit time integration and features optimal scalability properties making use of the open-source libraries METIS and MPI for mesh partitioning and message passing.

SPEED is jointly developed at Politecnico di Milano by The Laboratory for Modeling and Scientific Computing MOX of the Department of Mathematics and by the Department of Civil and Environmental Engineering

Bulletin of the Seismological Society of America, Vol. 108, No. 3A, pp. 1272-1286, June 2018, doi: 10.1785/0120170293

Broadband Ground Motions from 3D Physics-Based Numerical Simulations Using Artificial Neural Networks

by Roberto Paolucci, Filippo Gatti, Maria Infantino, Chiara Smerzini, Ali Güneş Özcebe, and Marco Stupazzini

(1) Training of an ANN (*una tantum*) based on a strong motion database (e.g., NGA)

(2) Response spectrum at short periods predicted by the ANN

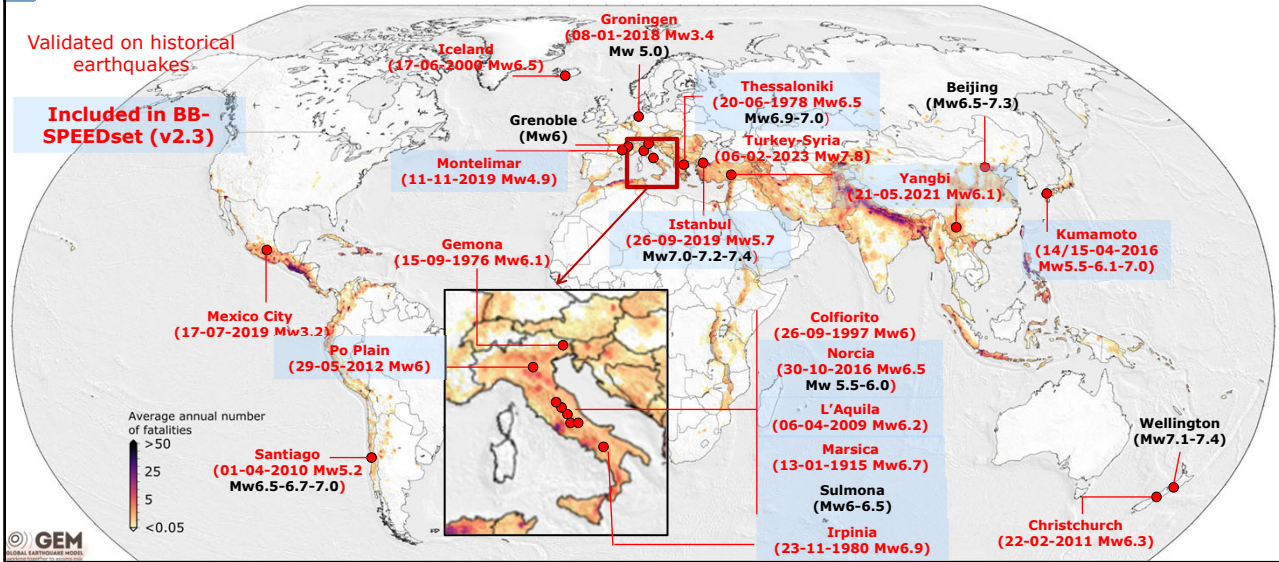

(3) Scaling the PBS waveform in order to match (within a tolerance) the ANN spectrum → ANN2BB

REVIEW ARTICLE

Selection and spectral matching of recorded ground motions for seismic fragility analyses

Vincenzo Manfredi<sup>1</sup> · Angelo Masi<sup>1</sup> · Ali Güneş Özcebe<sup>2</sup> · Roberto Paolucci<sup>2</sup> · Chiara Smerzi<sup>2</sup>

# Software tool for ground motion selection enhanced by PBS

The screenshot displays the 'S&M | Define Target Spectrum' window on the left and the 'Select & Match v1.0' main interface on the right. The 'Define Target Spectrum' window includes options for 'Site Class' (B), 'Target spectrum' (From file, H, HV, Eurocode 8, ASCE 7-10), and 'Site Classification Scheme' (From Dataset, User-defined). It features two graphs: 'Spectral acceleration (g)' vs 'T (sec)' and 'Spectral displacement (cm)' vs 'T (sec)'. A 'TARGET SPECTRUM' box lists 'USER-DEFINED' and 'NORMS (EC8, ASCE)'. The main interface shows '3. Select/Import Accelerograms' with 'Select from Dataset' selected. A 'Dataset' window lists 'SIMBAD\_v06', 'NGAWest2', and 'BB-SPEEDset\_v2.3'. A callout box highlights 'POSSIBILITY TO SELECT REAL AND SIMULATED GM DATABASES (NGA-WEST2, BB-SPEEDSET)'. A graph on the right shows 'Spectral acceleration (g)' vs 'Period (sec)'. The bottom of the main interface has the text: 'Import accelerogram from files / search for accelerograms from datasets. (You need to load dataset)'.

# Structural model and inelastic EDPs

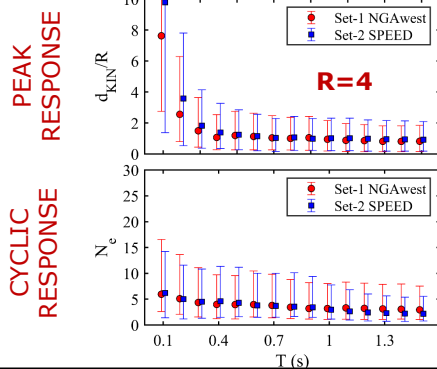

Inelastic SDOF systems with:

- Elasto-plastic backbone curve (EPP)
- Vibration period from T=0.1 to 1.5 s
- Strength reduction factors R=2, 4, 6
- Constant-strength systems

- Peak Response:** displacement ductility over strength reduction factor

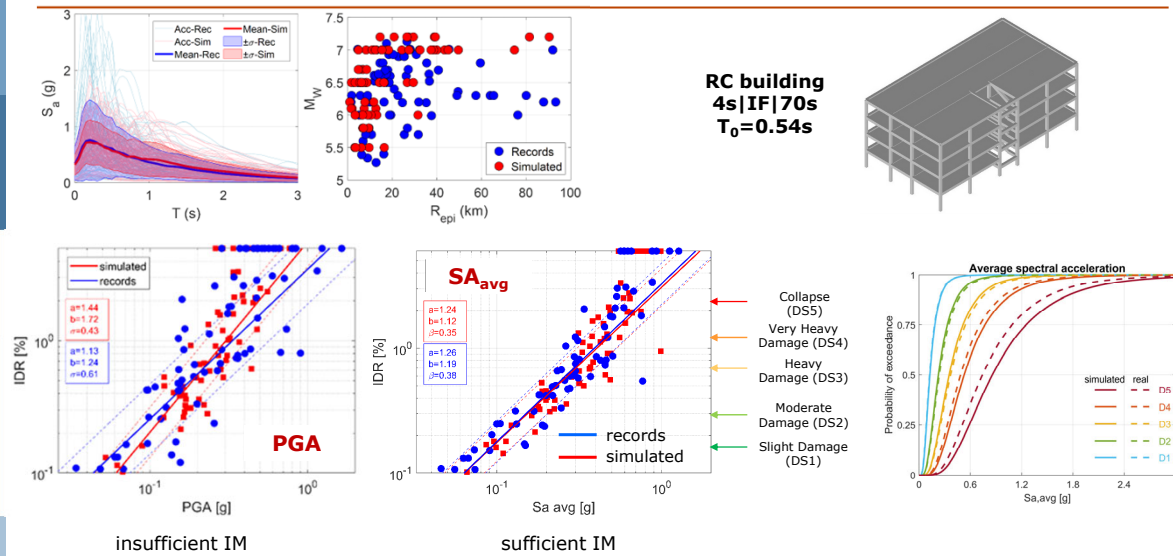

- Cyclic Response:** equivalent number of hysteresis cycles

16

## Fragility curves from recorded and simulated ground-motion sets

17

17

## Concluding remarks

- ❑ Building confidence in utilization of datasets of regional-scale PBS for earthquake engineering applications requires **extensive validations** of simulated ground motions, in a **broad frequency range**.
- ❑ Validation should involve **checks on both ground-motion IMs and EDPs**, from both historical and datasets of scenario earthquakes in a **sufficiently wide (M,R) range**.
- ❑ Availability and dissemination of **simulated ground motion datasets**, such as BB-SPEEDset, preferably **embedded in ground-motion selection tools**, is a key step for this purpose.
- ❑ Efforts are still needed towards the definition of **common acceptance criteria** and **standards** for the validation checks on simulated ground motions.
